I. Background

Mountainside Medical Center is undertaking a comprehensive assessment of the health needs of individuals living in their primary service area. The aim of the assessment is to reinforce Mountainside Medical Center's commitment to the health of residents and to align its health prevention efforts with the community's greatest needs.

The data contained in this report are a compilation of existing demographic and health data also known as "secondary data." The data was gathered and integrated into the report by Hackensack Meridian Health. The specific data sources are listed throughout the report. It should be noted that in some cases, local-level data may be limited or dated. This is an inherent limitation with secondary data. The most recent data is used whenever possible. When available, state and national comparisons are also provided as benchmarks for the regional statistics. National comparisons include United States data and Healthy People 2020 (HP 2020) goals when available.

It is also important to note that social determinants, such as income and education, can significantly impact health status, health behaviors, and health outcomes. Research has shown that lower educational attainment, poverty, and race/ethnicity are risk factors for certain health conditions. For this reason, local demographic information is included in the report for reference.

A Conclusions section is included at the end of the report to highlight strengths and opportunities. State and national comparative data generally determine if an indicator is a strength or opportunity within the community. However, it is still important for readers to interpret the service level data and make appropriate conclusions, independent of the state and national comparisons.

The secondary data profile is one component of the research. Mountainside Medical Center will use the data from the secondary data profile in conjunction with other research components to understand health needs of the community it serves and create an implementation strategy to address the identified needs.

II. Reading the Results

Demographic and health indicator statistics have been collated to portray the current health status of Mountainside Medical Center’s primary service area. For all of the statistics provided, the most recently published data at the service area level were utilized.

For all demographic and health indicator statistics, data from the following municipalities were incorporated. Due to the availability of this data, health indicator statistics represent crude rates only. Crude rates are generally defined as the total number of cases or deaths divided by the total population at risk. Crude rate is generally presented as per populations of 1,000, 10,000 or 100,000 (which will be noted on each table). It is based on raw data and does not account for characteristics such as age, race, and gender.

Primary Service Area
Municipalities
Bloomfield Township
Montclair Township
Cedar Grove Township
Caldwell Borough
Nutley Township
Upper Montclair Township
Glen Ridge Borough

Definitions

Age-Adjusted Rate - Assumes equal age distributions between populations to account for the effect of age on disease and death rates.

Crude Rate - Generally defined as the total number of cases or deaths divided by the total population at risk. Crude rate is generally presented as per populations of 1,000, 10,000 or 100,000. It is based on raw data and does not account for characteristics such as age, race, and gender.

Family - Defined as more than one person living together, either as relations or as a married couple.

Frequency - Often denoted by the symbol "n," frequency is the number of occurrences of an event.

Household - Defined as one or more people sharing a residence. Examples include college students sharing an apartment or a single male living alone.

Incidence Rate - The number of new cases per population at risk in a given time period.

Infant Mortality Rate - Defined as the number of infant deaths per 1,000 live births per year. Infant is defined as being less than one year of age.

Low Birth Weight - Indicates a birth weight less than 5 pounds, 3 ounces (2,500 grams).

Neonatal Mortality Rate - Defined as the number of infant deaths in the first 27 days after birth per 1,000 live births per year.

Post-Neonatal Mortality Rate - Defined as the number of infant deaths occurring from 28 days to 12 months per 1,000 live births per year.

Poverty Guidelines - A version of the federal poverty measure issued each year in the *Federal Register* by the Department of Health & Human Services. The guidelines are a simplification of the poverty thresholds used for administrative purposes (i.e., determining eligibility for certain federal programs).

Very Low Birth Weight - Indicates a birth weight less than 3 pounds, 5 ounces (1,500 grams).

Healthy People 2020 (HP2020) - is a set of goals and objectives with 10-year targets designed to help guide national health promotion and disease prevention.

III. Demographic Statistics

A. Population Statistics

Table A1. Overall Population (2010; 2012 - 2016)

	U.S.		New Jersey		Essex County		Primary Service Area	
Population	318,558,162		8,915,456		792,586		160,811	
Population change between 2009-2013 and 2012-2016	4.80%		2.22%		1.50%		5.90%

V. Conclusions

The following conclusions are drawn from comparisons of the service areas to New Jersey and U.S. secondary data. They are categorized as Areas of Strength, Areas of Opportunity, or Areas of Difference. Areas of Strength highlight factors in which one or more of the service areas have a more favorable outcome than New Jersey and the U.S. In contrast, Areas of Opportunity highlight factors in which one or more of the service areas can improve upon in comparison to the state and the nation. Where the service areas differ notably from the state and national data, but cannot be considered to be strengths or opportunities, are considered Areas of Difference. For example, if one of the service areas has a notably larger male population versus female population, this is neither a strength nor an opportunity, but it is an Area of Difference.

AREAS OF STRENGTH

❖ **Household Statistics**

- The percentage of grandparents responsible for their grandchildren is lower in the primary service area (19.4%), when compared to the state (25.2%), and the nation (36.5%).
- The percentage of vacant housing units in the primary service area (4.8%) is lower, when compared to New Jersey (10.9%), and the nation (12.2%).

❖ **Income Statistics**

- The percentage of households with an income of \$200,000 or more is greater in the primary service area (73.8%) than the state (10.8%), and the nation (5.7%).
- The percentage of families living in poverty is less in the primary service area (4.3%), than in New Jersey (7.9%), and the nation (11.3%).
- There are less individuals living in poverty in the primary service area (5.9%), when compared to New Jersey (8.1%), and the nation (12.2%).

❖ **Education Statistics**

- The percentage of individuals that have a Bachelor's degree or higher is greater for the primary service area (57.8%), than the state (37.5%), and the nation (30.3%).
- The percentage of individuals that have a graduate or professional degree is higher in the primary service area (21.2%), than in the state (14.4%), and the nation (11.5%).

❖ **Health Statistics**

- The percentage of individuals with health insurance coverage is higher in the primary service area (93.5%), when compared to the state (89.3%), and the nation (88.3.0%).

❖ **County Health Rankings**

- One-hundred percent of individuals in Essex County have access to exercise opportunities, which is high, when compared to the state (95.0%), and the National Benchmark (91.0%).

AREAS OF OPPORTUNITY

❖ **Housing Statistics**

- The percentage of households spending 35% or more of their income on mortgage/owner costs in the primary service area (38.1%), is higher than the state (30.7%), and the nation (23.3%).
- The percentage of households spending 35% or more of their income on rent for the primary service area is 36.4%. That percent is less than the state (44.1%), and the nation (42.0%); however, that percent shows that a large portion of the individuals renting are living in burden, due to their housing costs.

❖ **Employment Statistics**

- The percentage of individuals that are unemployed is now greater in the primary service area (6.0%), when compared to the state (5.2%), and the nation (4.7%).

❖ **Health Statistics**

- The percentage of county-wide low birth weights (9.7%) is higher than the state (8.1%) and the nation (8.1%).
- The gonorrhea incidence rate in Essex County (249.5) is significantly greater than the state (105.0) and the nation (145.8).
- The incidence rate of chlamydia cases in Essex County (753.7) is nearly double the rate of the state (392.0) and higher than the nation (528.8).
- The rate of hospitalizations due to asthma is higher in Essex County (12.3) than the state (7.3).

❖ **Chronic Conditions Statistics**

- The prevalence of chronic conditions among Medicare beneficiaries is higher for Alzheimer's, Diseases, Asthma, Chronic Kidney Disease, Diabetes, Heart Failure, Ischemic Heart Disease, Osteoporosis, and Stroke, when compared to New Jersey and the nation.
- Hospital readmissions for chronic conditions for Medicare beneficiaries is higher in the primary service area for 6 or more chronic conditions (26.0%), when compared to the state (23.24%), and the nation (22.78%).
- The standardized per capita spending among Medicare beneficiaries, for six or more chronic conditions, is higher in the primary service area (\$32,844), than in New Jersey (\$29,833), and the nation (\$30,121).

❖ **County Health Rankings**

- Premature death (in years) is greatest in Essex County (7,103), when compared to the state (5,460), and the National Benchmark (5,300).
- The rate of new chlamydia cases per 100,000 population is highest in Essex County (698), when compared to the state (351) and the National Benchmark (145.1).
- The teen birth rate in Essex County (24) is much higher than the state (15) and National Benchmark (15).
- The uninsured population (65 years and younger) is greatest in Essex County (14.0%),

when compared with New Jersey (10.0%), and the National Benchmark (6.0%).

- The violent crime rate in Essex County (681) is nearly 2.5 times the rate of the state (280) and astronomically higher than the National Benchmark (62).
- The physical environment rank for Essex County is ranked 19 out of 21 counties in the state of New Jersey. *Essex County was previously ranked 4th in 2015.*

AREAS OF DIFFERENCE

❖ Population Statistics

- For the overall population, there has been an increase between 2010 and the 2012 - 2016 estimates in both the nation (4.80%), and New Jersey (2.22%). However, the primary service area experienced the largest population increase (5.90%).
- The percentage of residents that speak only English in the primary service area (76.1%) is less than the percent in the nation (78.9%), but greater than New Jersey (69.3%).

❖ Income Statistics

- The mean household income is higher in the primary service area (\$136,866) than in New Jersey (\$101,634), and the nation (\$77,866).

❖ Employment Statistics

- The percentage of workers who drive alone to work is higher in the primary service area (68.7%), but is less than the state (71.7%), and the nation (76.4%).
- The percentage of workers who use public transportation to get to work is higher in the primary service area (16.8%), when compared to New Jersey (11.2%), and the nation (5.1%).
